

Sample Structured Document

Introduction

This format shows what a structured modular document looks like.

Description

Each module includes independent “bits” of information, and requires a “byte” format/structure before one publishes the document.

Definition

A “byte” is a minimum group of modules formatted as a publishable document.

A byte includes a title and at least two “bits” of information,

- One bit is the “Introduction” that orients the user to the document’s
 - purpose,
 - source, *or*
 - content of the document.
 - Other bits include support information for different fields, such as:
 - action,
 - situation,
 - concept,
 - construct,
 - process,
 - fact, *or*
 - metaconcept.
-

Examples

The “Definition” bit is an example of a bit that supports the “concept” field, by telling the reader what something is or is not.

The “Description” bit is an example of a bit that supports the “construct” field, by telling the reader what something looks like.
